Restricted Boltzmann Machines

Neural Networks Online Course

- **Disclaimer:** Much of the material and slides for this lecture were borrowed from Hugo Larochelle's class on Neural Networks:

- Hugo's class covers many other topics: convolutional networks, neural language model, Boltzmann machines, autoencoders, sparse coding, etc.

- We will use his material for some of the other lectures.

http://info.usherbrooke.ca/hlarochelle/neural_networks

RESTRICTED BOLTZMANN MACHINE

Topics: RBM, visible layer; hidden layer; energy function

Energy function:
$$\begin{aligned} E(\mathbf{x}, \mathbf{h}) &= -\mathbf{h}^T \mathbf{W} \mathbf{x} - \mathbf{c}^T \mathbf{x} - \mathbf{b}^T \mathbf{h} \\ &= -\sum_j \sum_k W_{j,k} h_j x_k - \sum_k c_k x_k - \sum_j b_j h_j \end{aligned}$$

Distribution: $p(\mathbf{x}, \mathbf{h}) = \exp(-E(\mathbf{x}, \mathbf{h}))/Z$

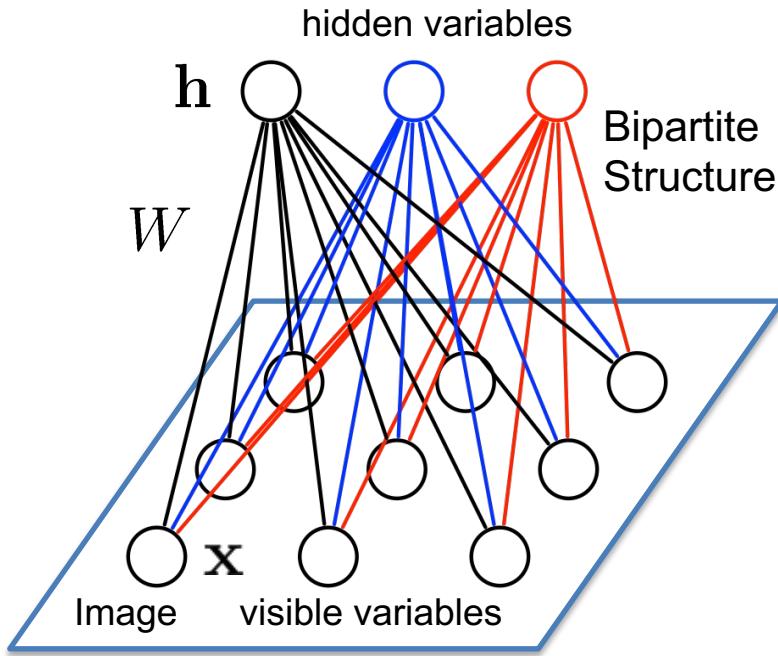

partition function
(intractable)

Unsupervised Learning

- Unsupervised learning: we only use the inputs $\mathbf{x}^{(t)}$ for learning
 - automatically extract meaningful features for your data
 - leverage the availability of unlabeled data
 - add a data-dependent regularizer to training ($-\log p(\mathbf{x}^{(t)})$)
- We will consider models for unsupervised learning that will form the basic building blocks for deeper models:
 - Restricted Boltzmann Machines
 - Autoencoders

Restricted Boltzmann Machines

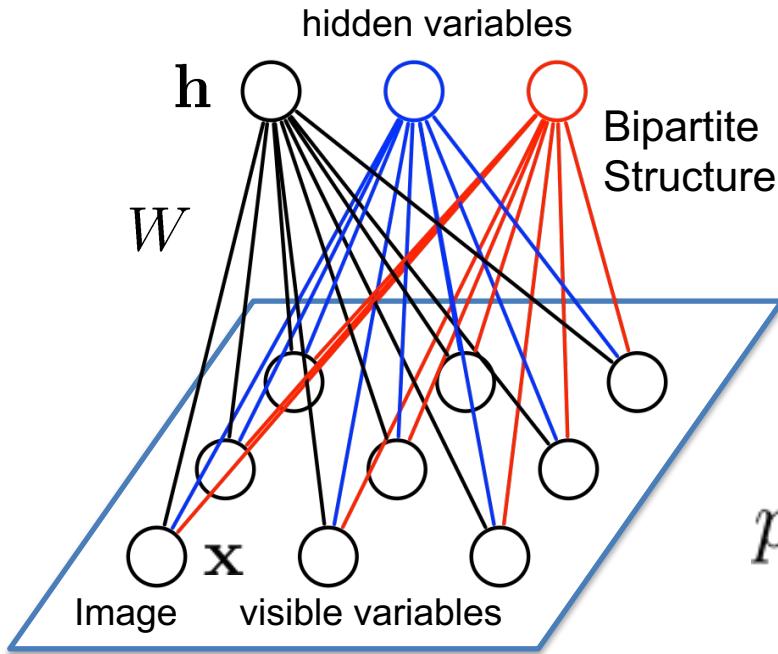

- Undirected bipartite graphical model
- Stochastic binary visible variables:
 $\mathbf{x} \in \{0, 1\}^D$
- Stochastic binary hidden variables:
 $\mathbf{h} \in \{0, 1\}^F$

- The energy of the joint configuration:

$$\begin{aligned} E(\mathbf{x}, \mathbf{h}) &= -\mathbf{h}^\top \mathbf{W} \mathbf{x} - \mathbf{c}^\top \mathbf{x} - \mathbf{b}^\top \mathbf{h} \\ &= -\sum_j \sum_k W_{j,k} h_j x_k - \sum_k c_k x_k - \sum_j b_j h_j \end{aligned}$$

Restricted Boltzmann Machines

- Probability of the joint configuration is given by the Boltzmann distribution:

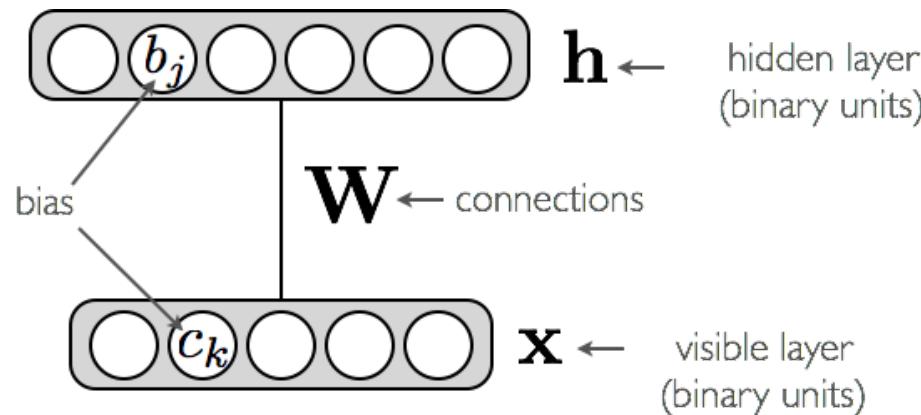

$$p(\mathbf{x}, \mathbf{h}) = \exp(-E(\mathbf{x}, \mathbf{h}))/Z$$

Partition function (intractable)

$$Z = \sum_{\mathbf{x}, \mathbf{h}} \exp(-E(\mathbf{x}, \mathbf{h}))$$

Restricted Boltzmann Machines

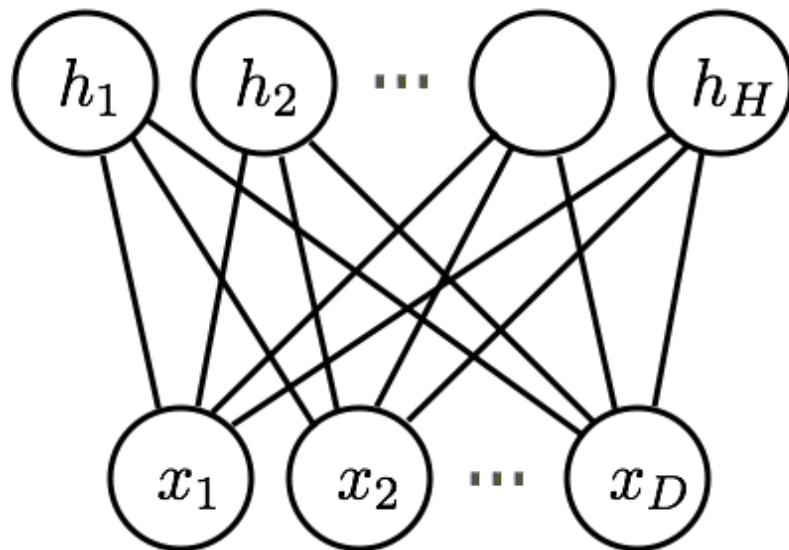

$$\begin{aligned} p(\mathbf{x}, \mathbf{h}) &= \exp(-E(\mathbf{x}, \mathbf{h}))/Z \\ &= \exp(\mathbf{h}^\top \mathbf{W} \mathbf{x} + \mathbf{c}^\top \mathbf{x} + \mathbf{b}^\top \mathbf{h})/Z \\ &= \exp(\mathbf{h}^\top \mathbf{W} \mathbf{x}) \exp(\mathbf{c}^\top \mathbf{x}) \exp(\mathbf{b}^\top \mathbf{h})/Z \end{aligned}$$

Factors

- The notation based on an **energy function** is simply an alternative to the representation as the product of factors

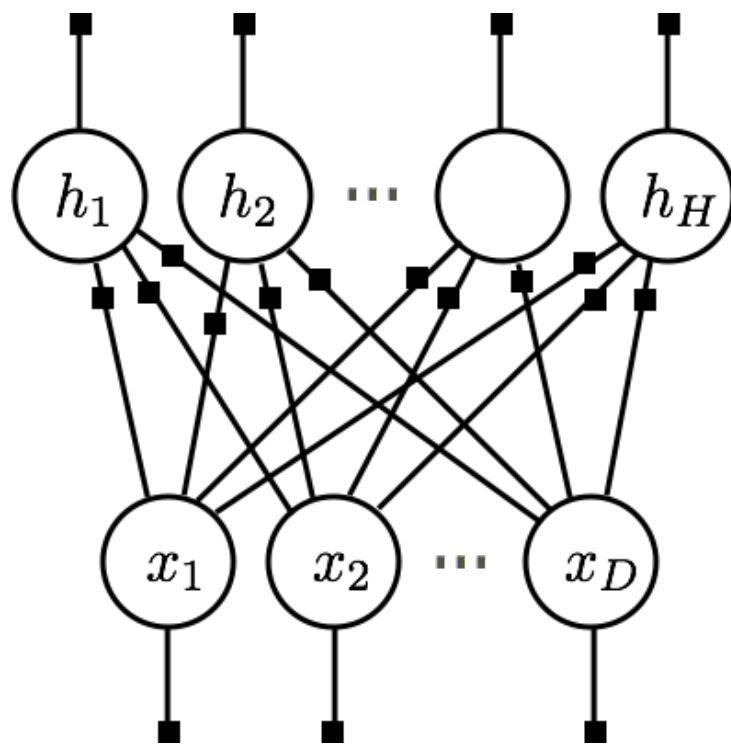

Restricted Boltzmann Machines

$$p(\mathbf{x}, \mathbf{h}) = \frac{1}{Z} \underbrace{\prod_j \prod_k}_{\text{Pair-wise factors}} \exp(W_{j,k} h_j x_k) \left. \begin{array}{l} \prod_k \exp(c_k x_k) \\ \prod_j \exp(b_j h_j) \end{array} \right\} \text{Unary factors}$$

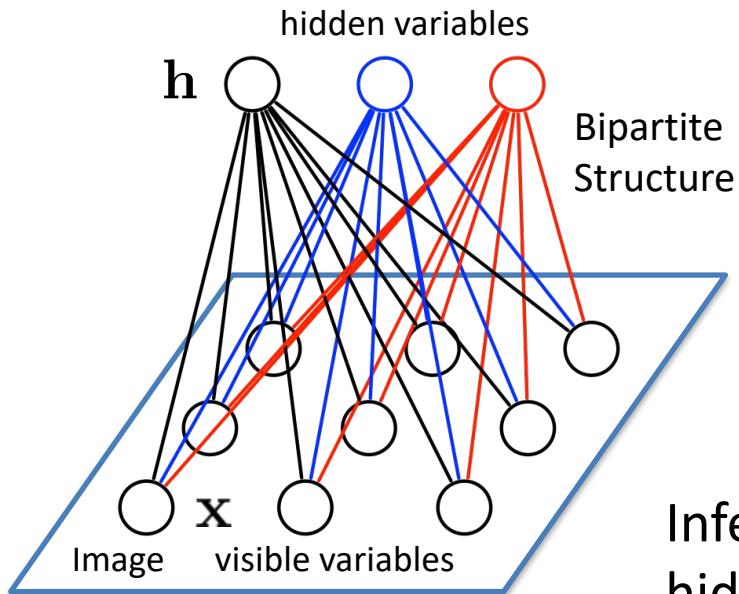

- The scalar visualization is more informative of the structure within the vectors.

Factor Graph View

$$p(\mathbf{x}, \mathbf{h}) = \frac{1}{Z} \underbrace{\prod_j \prod_k}_{\text{Pair-wise factors}} \exp(W_{j,k} h_j x_k) \underbrace{\left(\prod_k \exp(c_k x_k) + \prod_j \exp(b_j h_j) \right)}_{\text{Unary factors}}$$

Inference

Restricted: No interaction between hidden variables

Inferring the distribution over the hidden variables is easy:

$$p(\mathbf{h}|\mathbf{x}) = \prod_j p(h_j|\mathbf{x})$$

Factorizes: Easy to compute

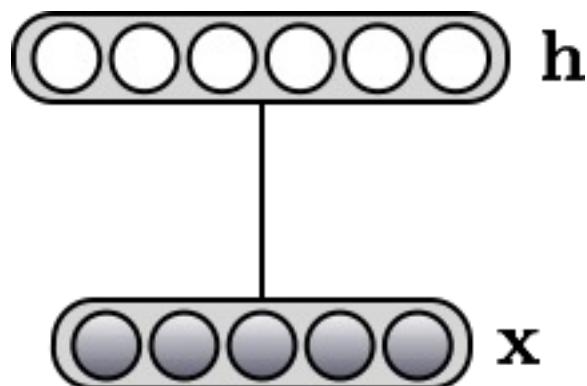

Similarly:

$$p(\mathbf{x}|\mathbf{h}) = \prod_k p(x_k|\mathbf{h})$$

Markov random fields, Boltzmann machines, log-linear models.

Inference

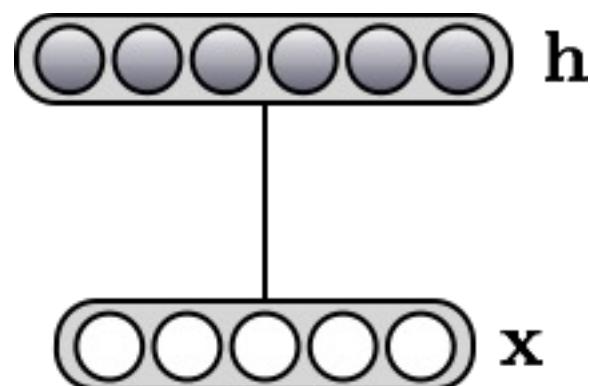

- Conditional Distributions:

$$p(\mathbf{h}|\mathbf{x}) = \prod p(h_j|\mathbf{x})$$

$$p(h_j = 1|\mathbf{x}) = \frac{1}{1 + \exp(-(b_j + \mathbf{W}_{j \cdot} \mathbf{x}))} \\ = \text{sigm}(b_j + \mathbf{W}_{j \cdot} \mathbf{x})$$

jth row of \mathbf{W}

$$p(\mathbf{x}|\mathbf{h}) = \prod_k p(x_k|\mathbf{h})$$

$$p(x_k = 1|\mathbf{h}) = \frac{1}{1 + \exp(-(c_k + \mathbf{h}^\top \mathbf{W}_{\cdot k}))} \\ = \text{sigm}(c_k + \mathbf{h}^\top \mathbf{W}_{\cdot k})$$

kth column of \mathbf{W}

Local Markov Property

- In general, we have the following property:

$$\begin{aligned} p(z_i | z_1, \dots, z_V) &= p(z_i | \text{Ne}(z_i)) \\ &= \frac{p(z_i, \text{Ne}(z_i))}{\sum_{z'_i} p(z'_i, \text{Ne}(z_i))} \\ &= \frac{\prod_f \text{ involving } z_i \text{ and any } \text{Ne}(z_i) \Psi_f(z_i, \text{Ne}(z_i))}{\sum_{z'_i} \prod_f \text{ involving } z_i \text{ and any } \text{Ne}(z_i) \Psi_f(z'_i, \text{Ne}(z_i))} \end{aligned}$$

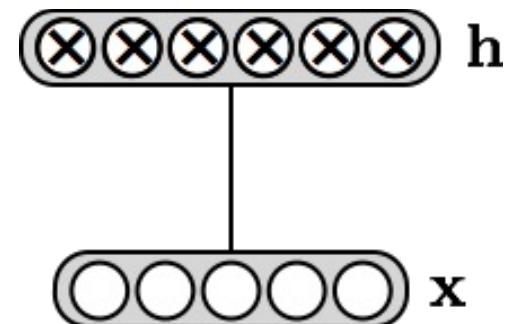

- z_i is any variable in the Markov network (x_k or h_j in an RBM)
- $\text{Ne}(z_i)$ are the neighbors of z_i in the Markov network

Free Energy

- What about computing **marginal** $p(\mathbf{x})$?

$$\begin{aligned} p(\mathbf{x}) &= \sum_{\mathbf{h} \in \{0,1\}^H} p(\mathbf{x}, \mathbf{h}) = \sum_{\mathbf{h} \in \{0,1\}^H} \exp(-E(\mathbf{x}, \mathbf{h}))/Z \\ &= \exp \left(\mathbf{c}^\top \mathbf{x} + \sum_{j=1}^H \log(1 + \exp(b_j + \mathbf{W}_{j \cdot} \mathbf{x})) \right) / Z \\ &= \exp(-F(\mathbf{x}))/Z \end{aligned}$$

Free Energy

Free Energy

- What about computing **marginal** $p(\mathbf{x})$?

$$\begin{aligned} p(\mathbf{x}) &= \sum_{\mathbf{h} \in \{0,1\}^H} \exp(\mathbf{h}^\top \mathbf{W}\mathbf{x} + \mathbf{c}^\top \mathbf{x} + \mathbf{b}^\top \mathbf{h}) / Z \\ &= \exp(\mathbf{c}^\top \mathbf{x}) \sum_{h_1 \in \{0,1\}} \dots \sum_{h_H \in \{0,1\}} \exp\left(\sum_j h_j \mathbf{W}_{j\cdot} \mathbf{x} + b_j h_j\right) / Z \\ &= \exp(\mathbf{c}^\top \mathbf{x}) \left(\sum_{h_1 \in \{0,1\}} \exp(h_1 \mathbf{W}_{1\cdot} \mathbf{x} + b_1 h_1) \right) \dots \left(\sum_{h_H \in \{0,1\}} \exp(h_H \mathbf{W}_{H\cdot} \mathbf{x} + b_H h_H) \right) / Z \\ &= \exp(\mathbf{c}^\top \mathbf{x}) (1 + \exp(b_1 + \mathbf{W}_{1\cdot} \mathbf{x})) \dots (1 + \exp(b_H + \mathbf{W}_{H\cdot} \mathbf{x})) / Z \\ &= \exp(\mathbf{c}^\top \mathbf{x}) \exp(\log(1 + \exp(b_1 + \mathbf{W}_{1\cdot} \mathbf{x}))) \dots \exp(\log(1 + \exp(b_H + \mathbf{W}_{H\cdot} \mathbf{x}))) / Z \\ &= \exp\left(\mathbf{c}^\top \mathbf{x} + \sum_{j=1}^H \log(1 + \exp(b_j + \mathbf{W}_{j\cdot} \mathbf{x}))\right) / Z \end{aligned}$$

- Also known as Product of Experts model.

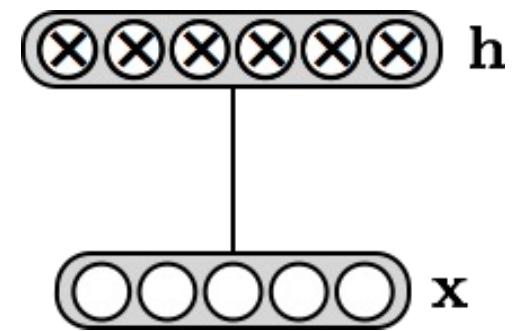

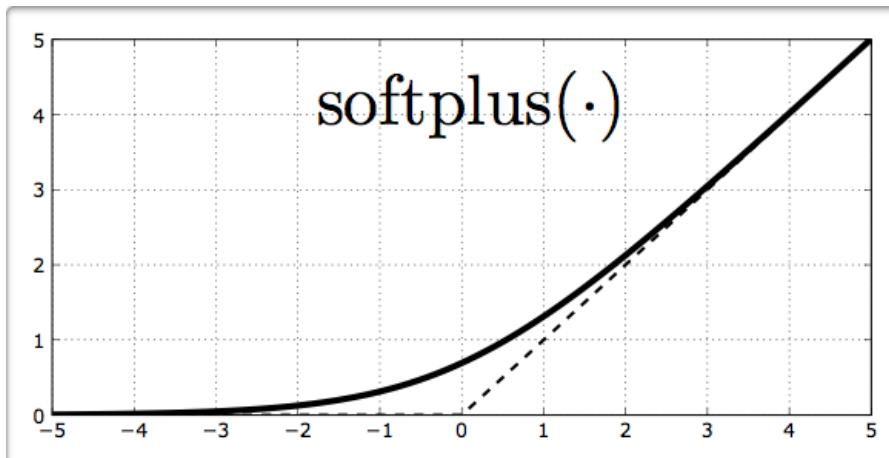

Free Energy

$$\begin{aligned} p(\mathbf{x}) &= \exp \left(\mathbf{c}^\top \mathbf{x} + \sum_{j=1}^H \log(1 + \exp(b_j + \mathbf{W}_j \cdot \mathbf{x})) \right) / Z \\ &= \exp \left(\mathbf{c}^\top \mathbf{x} + \sum_{j=1}^H \text{softplus}(b_j + \mathbf{W}_j \cdot \mathbf{x}) \right) / Z \end{aligned}$$

bias the probability of each x_i

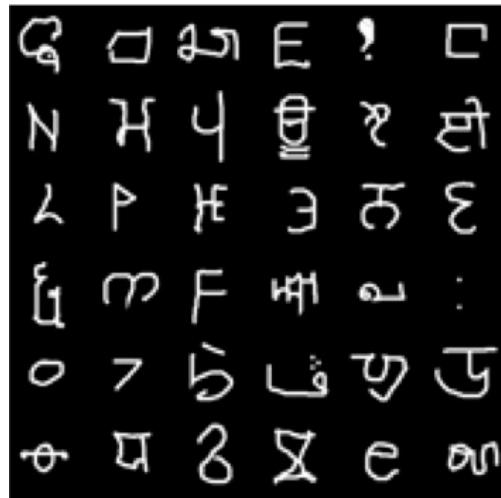

bias of each feature

feature expected in \mathbf{x}

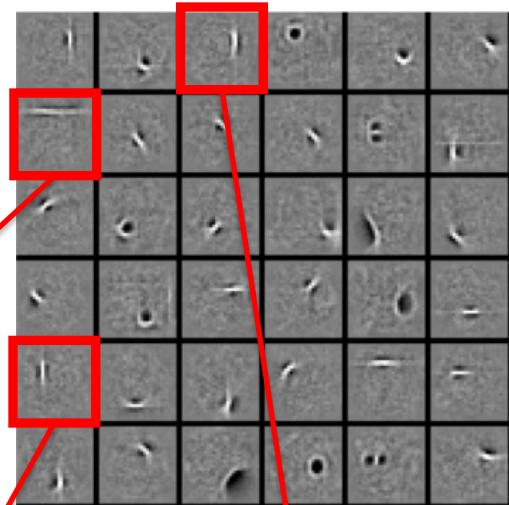

Learning Features

Observed Data
Subset of 25,000 characters

Learned W: “edges”
Subset of 1000 features

New Image: $p(h_7 = 1|v)$

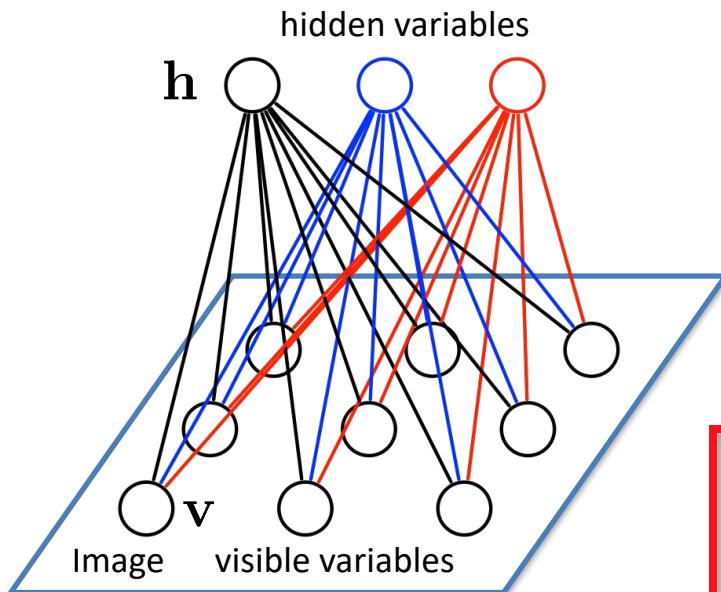

$$= \sigma\left(0.99 \times \begin{array}{c} \text{small image} \\ \downarrow \end{array} + 0.97 \times \begin{array}{c} \text{small image} \\ \downarrow \end{array} + 0.82 \times \begin{array}{c} \text{small image} \\ \dots \end{array}\right)$$

$$\sigma(x) = \frac{1}{1+\exp(-x)}$$

Logistic Function: Suitable for
modeling binary images

Represent:  as $P(\mathbf{h}|v) = [0, 0, 0.82, 0, 0, 0.99, 0, 0 \dots]$

Model Learning

- Given a set of *i.i.d.* training examples we want to minimize the average negative log-likelihood (NLL):

$$\frac{1}{T} \sum_t l(f(\mathbf{x}^{(t)})) = \frac{1}{T} \sum_t -\log p(\mathbf{x}^{(t)})$$

Remember:

$$p(\mathbf{x}, \mathbf{h}) = \exp(-E(\mathbf{x}, \mathbf{h}))/Z$$

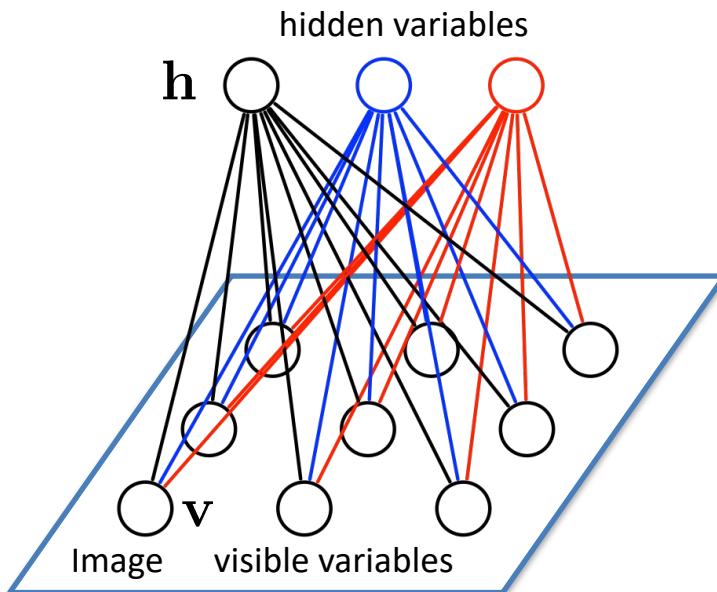

- Derivative of the negative log-likelihood objective:

$$\frac{\partial -\log p(\mathbf{x}^{(t)})}{\partial \theta} = \mathbb{E}_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}^{(t)}, \mathbf{h})}{\partial \theta} \mid \mathbf{x}^{(t)} \right] - \mathbb{E}_{\mathbf{x}, \mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta} \right]$$

Positive Phase

Negative Phase
Hard to compute

Model Learning

$$p(\mathbf{x}, \mathbf{h}) = \exp(-E(\mathbf{x}, \mathbf{h}))/Z$$

$$p(\mathbf{h}|\mathbf{x}) = \prod_j p(h_j|\mathbf{x})$$

- Derivative of the negative log-likelihood objective:

$$\frac{\partial -\log p(\mathbf{x}^{(t)})}{\partial \theta} = E_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}^{(t)}, \mathbf{h})}{\partial \theta} \mid \mathbf{x}^{(t)} \right] - E_{\mathbf{x}, \mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta} \right]$$

Data-Dependent
Expectations w.r.t $P(\mathbf{h}|\mathbf{x})$

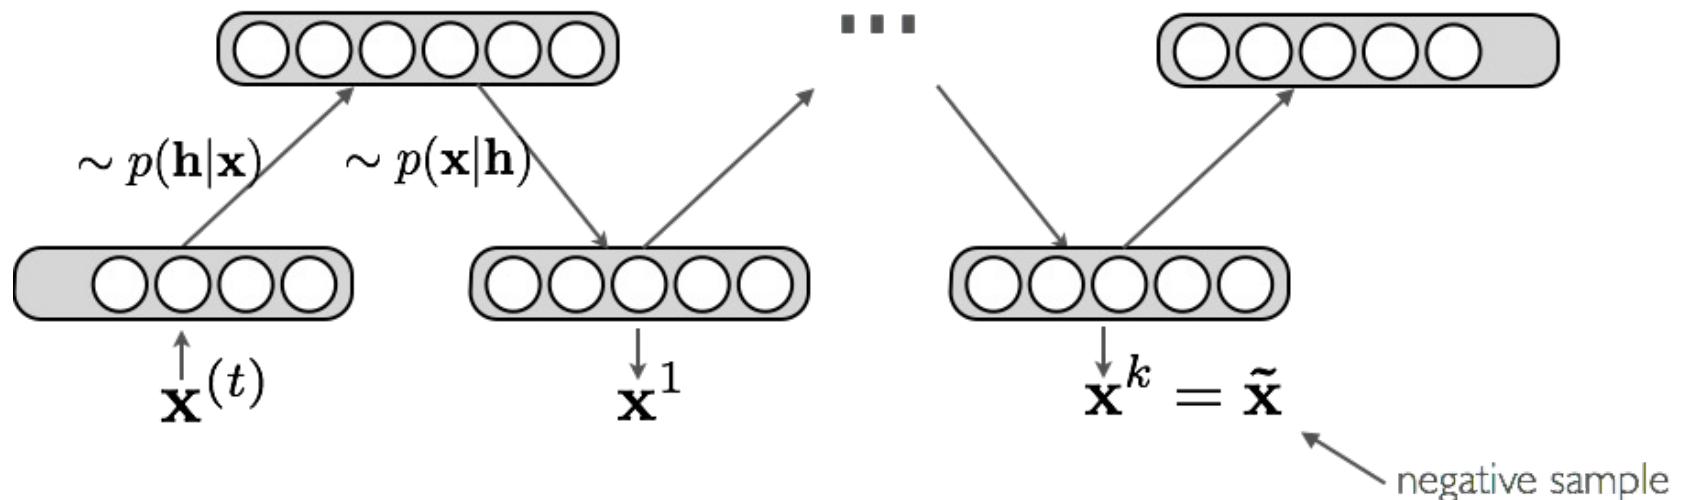

Model: Expectation
w.r.t joint $P(\mathbf{x}, \mathbf{h})$

- Second term: intractable due to exponential number of configurations.

Contrastive Divergence

- Key idea behind Contrastive Divergence:

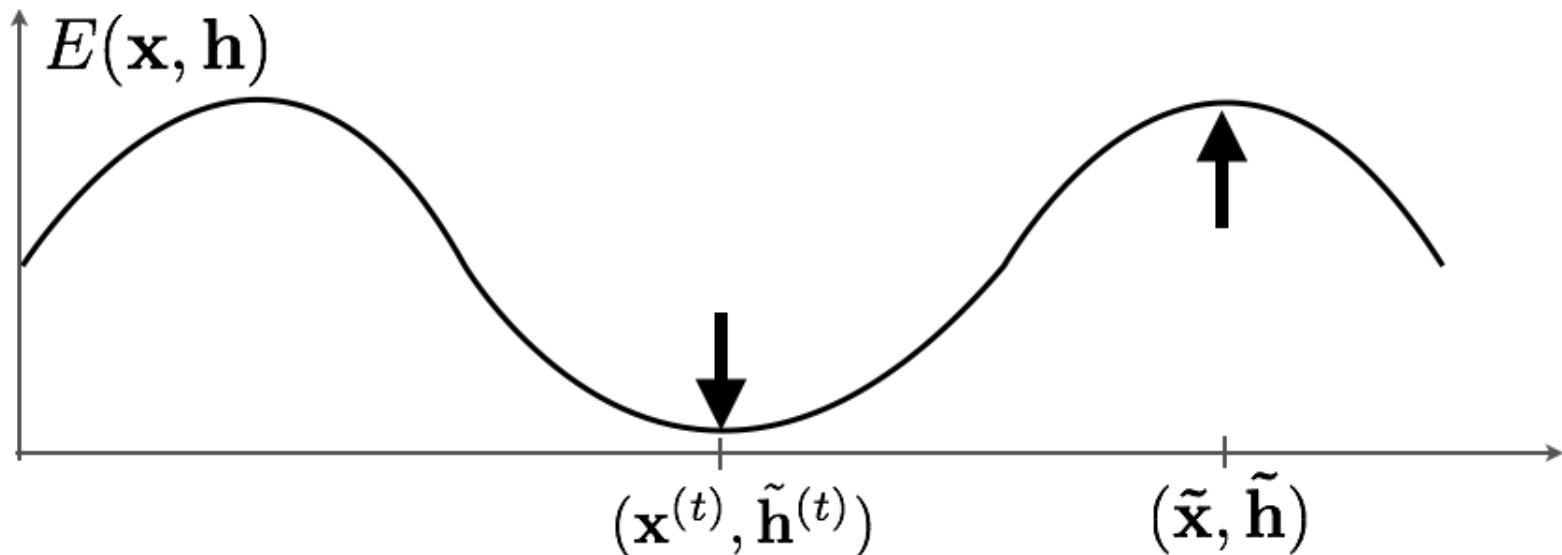

- Replace the expectation by a **point estimate** at $\tilde{\mathbf{x}}$
- Obtain the point $\tilde{\mathbf{x}}$ by Gibbs sampling
- Start sampling chain at $\mathbf{x}^{(t)}$

Contrastive Divergence

- Intuition: $\frac{\partial -\log p(\mathbf{x}^{(t)})}{\partial \theta} = \mathbb{E}_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}^{(t)}, \mathbf{h})}{\partial \theta} \mid \mathbf{x}^{(t)} \right] - \mathbb{E}_{\mathbf{x}, \mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta} \right]$

$$\mathbb{E}_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}^{(t)}, \mathbf{h})}{\partial \theta} \mid \mathbf{x}^{(t)} \right] \approx \frac{\partial E(\mathbf{x}^{(t)}, \tilde{\mathbf{h}}^{(t)})}{\partial \theta} \quad \mathbb{E}_{\mathbf{x}, \mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta} \right] \approx \frac{\partial E(\tilde{\mathbf{x}}, \tilde{\mathbf{h}})}{\partial \theta}$$

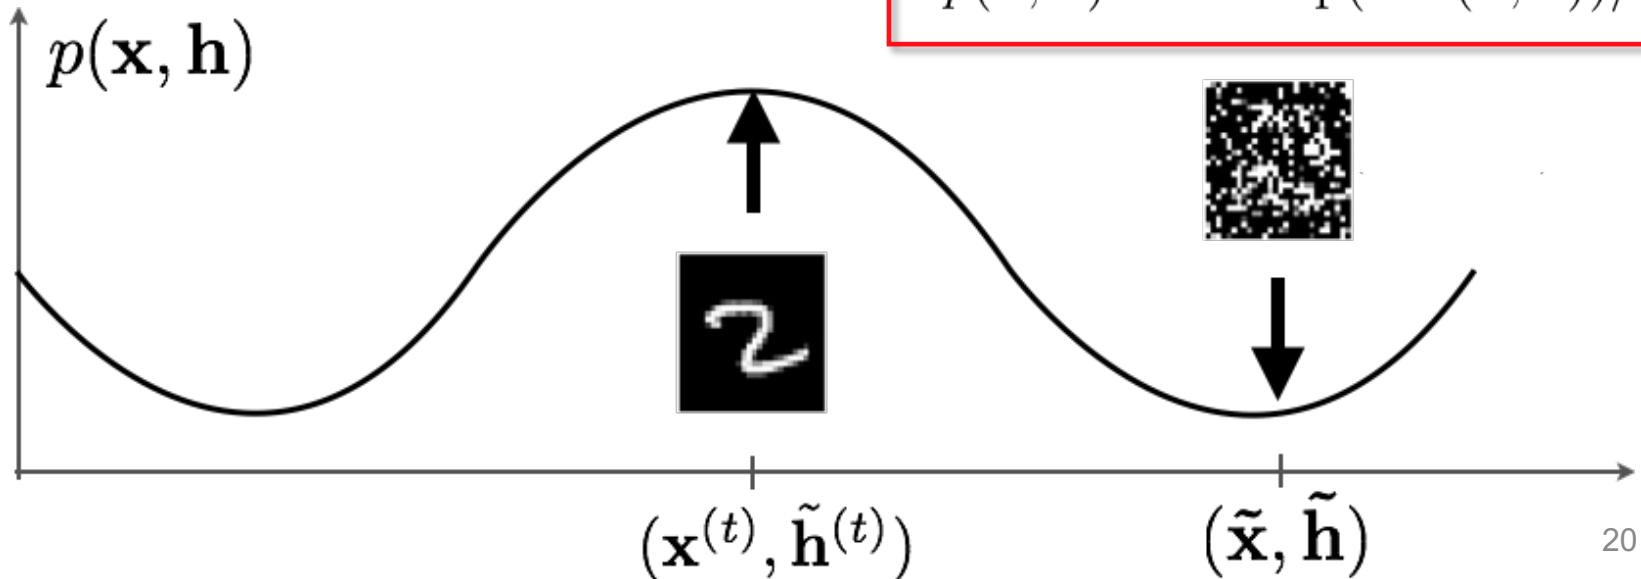

Contrastive Divergence

- Intuition: $\frac{\partial -\log p(\mathbf{x}^{(t)})}{\partial \theta} = \mathbb{E}_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}^{(t)}, \mathbf{h})}{\partial \theta} \mid \mathbf{x}^{(t)} \right] - \mathbb{E}_{\mathbf{x}, \mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta} \right]$

$$\mathbb{E}_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}^{(t)}, \mathbf{h})}{\partial \theta} \mid \mathbf{x}^{(t)} \right] \approx \frac{\partial E(\mathbf{x}^{(t)}, \tilde{\mathbf{h}}^{(t)})}{\partial \theta} \quad \mathbb{E}_{\mathbf{x}, \mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta} \right] \approx \frac{\partial E(\tilde{\mathbf{x}}, \tilde{\mathbf{h}})}{\partial \theta}$$

Remember:

$$p(\mathbf{x}, \mathbf{h}) = \exp(-E(\mathbf{x}, \mathbf{h}))/Z$$

Deriving Learning Rule

- Let us look at derivative of $\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta}$ for $\theta = W_{jk}$

$$\begin{aligned}\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial W_{jk}} &= \frac{\partial}{\partial W_{jk}} \left(-\sum_{jk} W_{jk} h_j x_k - \sum_k c_k x_k - \sum_j b_j h_j \right) \\ &= -\frac{\partial}{\partial W_{jk}} \sum_{jk} W_{jk} h_j x_k \\ &= -h_j x_k\end{aligned}$$

Remember:
 $E(\mathbf{x}, \mathbf{h}) = -\mathbf{h}^\top \mathbf{W} \mathbf{x} - \mathbf{c}^\top \mathbf{x} - \mathbf{b}^\top \mathbf{h}$

- Hence:

$$\nabla_{\mathbf{W}} E(\mathbf{x}, \mathbf{h}) = -\mathbf{h} \mathbf{x}^\top$$

Deriving Learning Rule

- Let us now derive $\mathbb{E}_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta} \middle| \mathbf{x} \right]$

$$\begin{aligned}\mathbb{E}_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial W_{jk}} \middle| \mathbf{x} \right] &= \mathbb{E}_{\mathbf{h}} \left[-h_j x_k \middle| \mathbf{x} \right] = \sum_{h_j \in \{0,1\}} -h_j x_k p(h_j | \mathbf{x}) \\ &= -x_k p(h_j = 1 | \mathbf{x})\end{aligned}$$

- Hence:

$$\mathbb{E}_{\mathbf{h}} [\nabla_{\mathbf{W}} E(\mathbf{x}, \mathbf{h}) | \mathbf{x}] = -\mathbf{h}(\mathbf{x}) \mathbf{x}^\top$$

$$\begin{aligned}\mathbf{h}(\mathbf{x}) &\stackrel{\text{def}}{=} \begin{pmatrix} p(h_1=1|\mathbf{x}) \\ \vdots \\ p(h_H=1|\mathbf{x}) \end{pmatrix} \\ &= \text{sigm}(\mathbf{b} + \mathbf{W}\mathbf{x})\end{aligned}$$

Deriving Learning Rule

- Hence:

$$E_{\mathbf{h}} [\nabla_{\mathbf{W}} E(\mathbf{x}, \mathbf{h}) | \mathbf{x}] = -\mathbf{h}(\mathbf{x}) \mathbf{x}^\top$$

$$\begin{aligned}\mathbf{h}(\mathbf{x}) &\stackrel{\text{def}}{=} \begin{pmatrix} p(h_1=1|\mathbf{x}) \\ \dots \\ p(h_H=1|\mathbf{x}) \end{pmatrix} \\ &= \text{sigm}(\mathbf{b} + \mathbf{W}\mathbf{x})\end{aligned}$$

$$\frac{\partial -\log p(\mathbf{x}^{(t)})}{\partial \theta} = E_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}^{(t)}, \mathbf{h})}{\partial \theta} \middle| \mathbf{x}^{(t)} \right] - E_{\mathbf{x}, \mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta} \right]$$

Easy to
compute exactly

$$\sum_{\mathbf{x}, \mathbf{h}} -\mathbf{h}(\mathbf{x}) \mathbf{x}^\top \mathbf{P}(\mathbf{x}, \mathbf{h})$$

Difficult to compute:
exponentially many
Configurations.

Approximate Learning

- An approximation to the gradient of the log-likelihood objective:

$$\frac{\partial - \log p(\mathbf{x}^{(t)})}{\partial \theta} = \mathbb{E}_{\mathbf{h}} \left[\frac{\partial E(\mathbf{x}^{(t)}, \mathbf{h})}{\partial \theta} \mid \mathbf{x}^{(t)} \right] - \mathbb{E}_{\mathbf{x}, \mathbf{h}} \left[\frac{\partial E(\mathbf{x}, \mathbf{h})}{\partial \theta} \right]$$

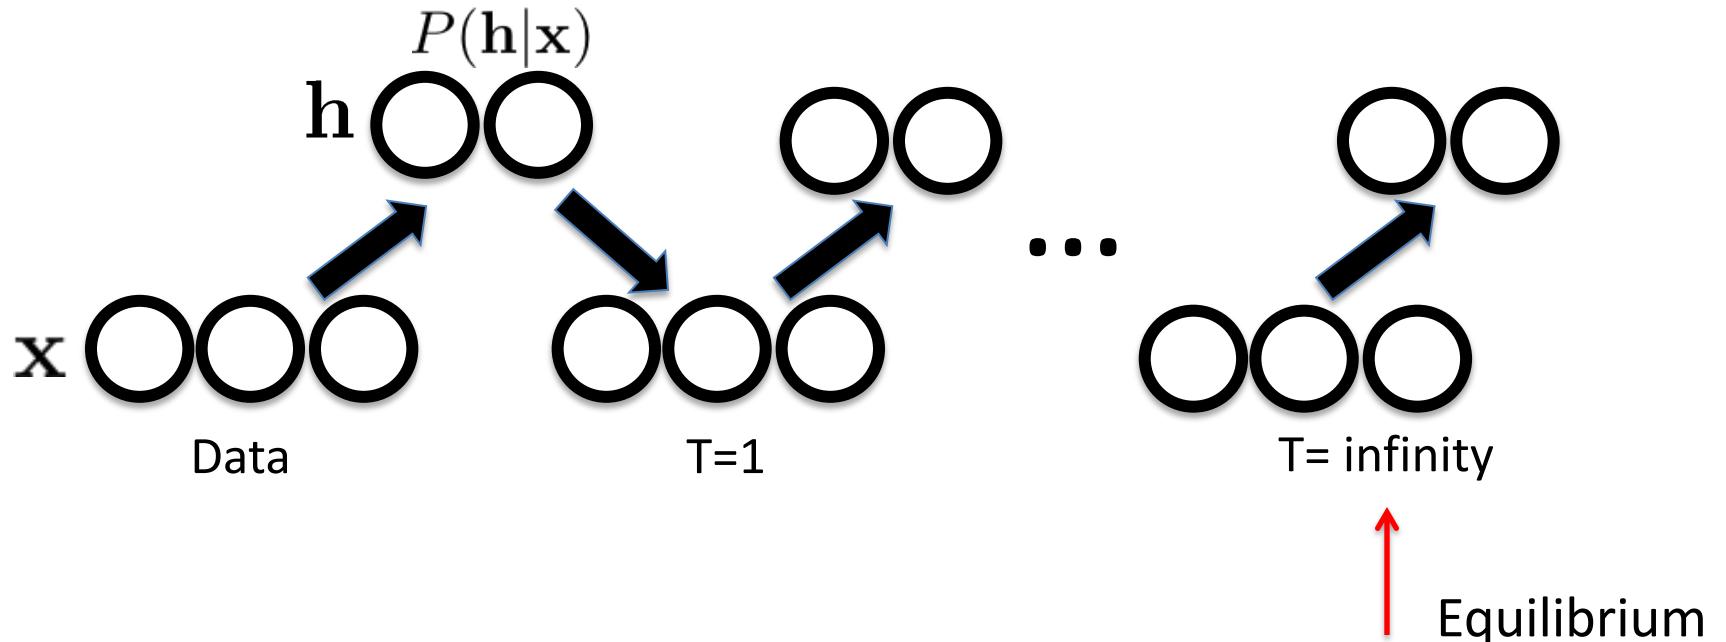

$$\sum_{\mathbf{x}, \mathbf{h}} -\mathbf{h}(\mathbf{x}) \mathbf{x}^\top \mathbf{P}(\mathbf{x}, \mathbf{h})$$

- Replace the average over all possible input configurations by samples.
- Run MCMC chain (Gibbs sampling) starting from the observed examples.

- Initialize $\mathbf{x}^0 = \mathbf{x}$
- Sample \mathbf{h}^0 from $P(\mathbf{h} \mid \mathbf{x}^0)$
- For $t=1:T$
 - Sample \mathbf{x}^t from $P(\mathbf{x} \mid \mathbf{h}^{t-1})$
 - Sample \mathbf{h}^t from $P(\mathbf{h} \mid \mathbf{x}^t)$

Approximate ML Learning for RBMs

Run Markov chain (alternating Gibbs Sampling):

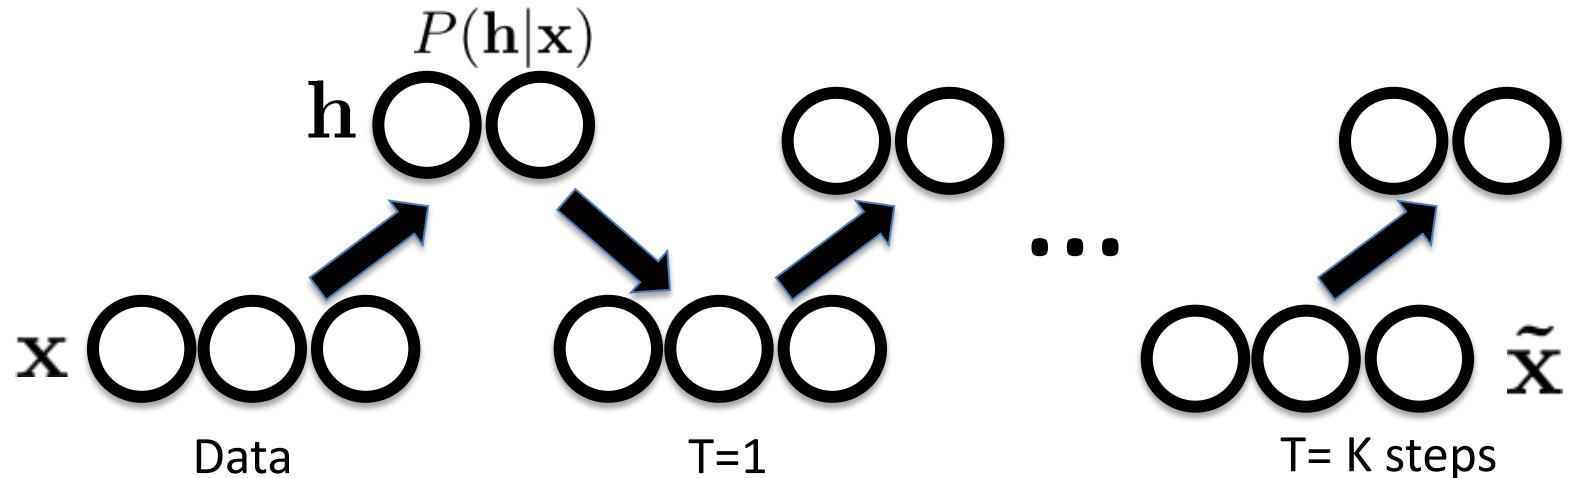

$$p(\mathbf{h}|\mathbf{x}) = \prod_j p(h_j|\mathbf{x})$$

$$p(\mathbf{x}|\mathbf{h}) = \prod_k p(x_k|\mathbf{h})$$

Contrastive Divergence

Run Markov chain (alternating Gibbs Sampling):

- K is typically set to 1.

$$p(\mathbf{h}|\mathbf{x}) = \prod_j p(h_j|\mathbf{x})$$

$$p(\mathbf{x}|\mathbf{h}) = \prod_k p(x_k|\mathbf{h})$$

Deriving Learning Rule

$$\mathbf{x}^{(t)} \quad \tilde{\mathbf{x}} \quad \theta = \mathbf{W}$$

$$\begin{aligned}\mathbf{W} &\Leftarrow \mathbf{W} - \alpha \left(\nabla_{\mathbf{W}} - \log p(\mathbf{x}^{(t)}) \right) \\ &\Leftarrow \mathbf{W} - \alpha \left(\mathbb{E}_{\mathbf{h}} \left[\nabla_{\mathbf{W}} E(\mathbf{x}^{(t)}, \mathbf{h}) \mid \mathbf{x}^{(t)} \right] - \mathbb{E}_{\mathbf{x}, \mathbf{h}} [\nabla_{\mathbf{W}} E(\mathbf{x}, \mathbf{h})] \right) \\ &\Leftarrow \mathbf{W} - \alpha \left(\mathbb{E}_{\mathbf{h}} \left[\nabla_{\mathbf{W}} E(\mathbf{x}^{(t)}, \mathbf{h}) \mid \mathbf{x}^{(t)} \right] - \mathbb{E}_{\mathbf{h}} [\nabla_{\mathbf{W}} E(\tilde{\mathbf{x}}, \mathbf{h}) \mid \tilde{\mathbf{x}}] \right) \\ &\Leftarrow \mathbf{W} + \alpha \left(\mathbf{h}(\mathbf{x}^{(t)}) \mathbf{x}^{(t)\top} - \mathbf{h}(\tilde{\mathbf{x}}) \tilde{\mathbf{x}}^\top \right)\end{aligned}$$

Learning rate

CD-k Algorithm

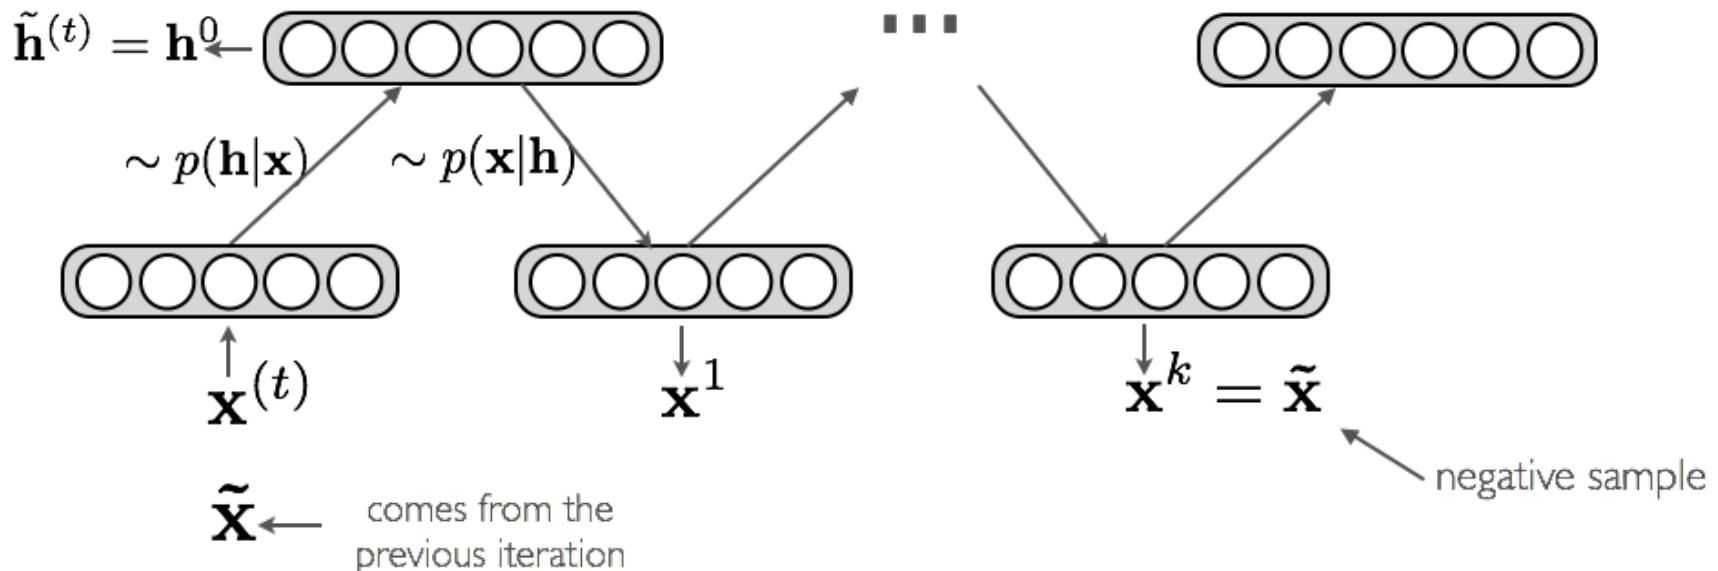

- For each training example $\mathbf{x}^{(t)}$
 - Generate a **negative sample** $\tilde{\mathbf{x}}$ using k steps of Gibbs sampling, starting at the data point $\mathbf{x}^{(t)}$
 - Update model parameters:
$$\mathbf{W} \leftarrow \mathbf{W} + \alpha \left(\mathbf{h}(\mathbf{x}^{(t)}) \mathbf{x}^{(t)\top} - \mathbf{h}(\tilde{\mathbf{x}}) \tilde{\mathbf{x}}^\top \right)$$
$$\mathbf{b} \leftarrow \mathbf{b} + \alpha \left(\mathbf{h}(\mathbf{x}^{(t)}) - \mathbf{h}(\tilde{\mathbf{x}}) \right)$$
$$\mathbf{c} \leftarrow \mathbf{c} + \alpha \left(\mathbf{x}^{(t)} - \tilde{\mathbf{x}} \right)$$
 - Go back to 1 until **stopping criteria**

CD-k Algorithm

- CD-k: contrastive divergence with k iterations of Gibbs sampling
 - In general, the bigger k is, the less biased the estimate of the gradient will be
 - In practice, k=1 works well for learning good features and for pre-training

Persistent CD: Stochastic ML Estimator

- **Idea:** instead of initializing the chain to $\mathbf{x}^{(t)}$, initialize the chain to the negative sample of the last iteration

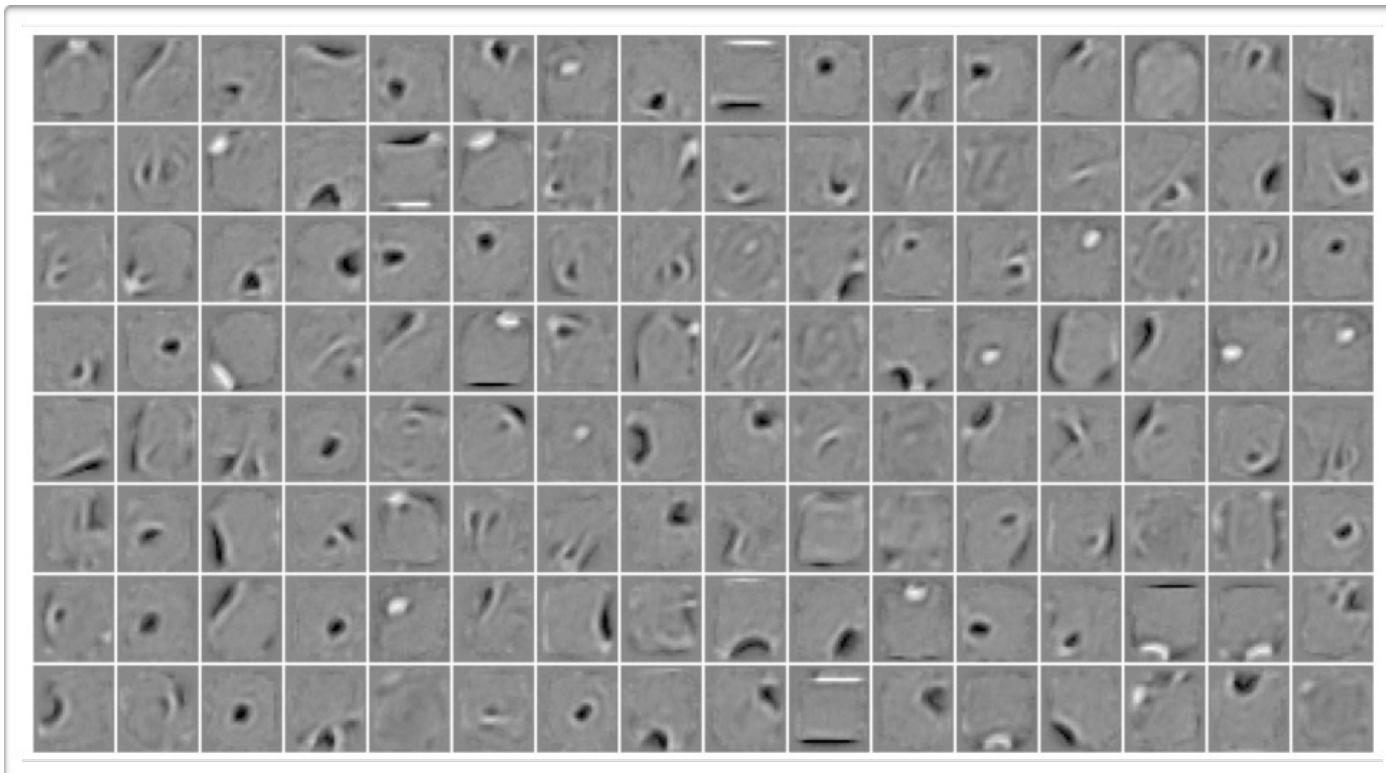

Example: MNIST

- MNIST dataset:

3	8	6	9	6	4	5	3	8	4	5	2	3	8	4	8
1	5	0	5	9	7	4	1	0	3	0	6	2	9	9	4
1	3	6	8	0	7	7	6	8	9	0	3	8	3	7	7
8	4	4	1	2	9	8	1	1	0	6	6	5	0	1	1
7	2	7	3	1	4	0	5	0	6	8	7	6	8	9	9
4	0	6	1	9	2	1	3	9	4	4	5	6	6	1	7
2	8	6	9	7	0	9	1	6	2	8	3	6	4	9	5
8	6	8	7	8	8	6	9	1	7	6	0	9	6	7	0

Learned Features

- MNIST dataset:

Tricks and Debugging

- Unfortunately, it is not easy to debug training RBMs (e.g. using gradient checks)
- We instead rely on **approximate** “tricks”
 - we plot the average **stochastic reconstruction** $\|\mathbf{x}^{(t)} - \tilde{\mathbf{x}}\|^2$ and see if it tends to decrease
 - for inputs that correspond to image, we visualize the connection coming into each hidden unit as if it was an image
 - gives an idea of the type of **visual feature** each hidden unit detects
 - we can also try to **approximate the partition function** Z and see whether the (approximated) NLL decreases

(Salakhutdinov, Murray, ICML 2008)

Gaussian Bernoulli RBMs

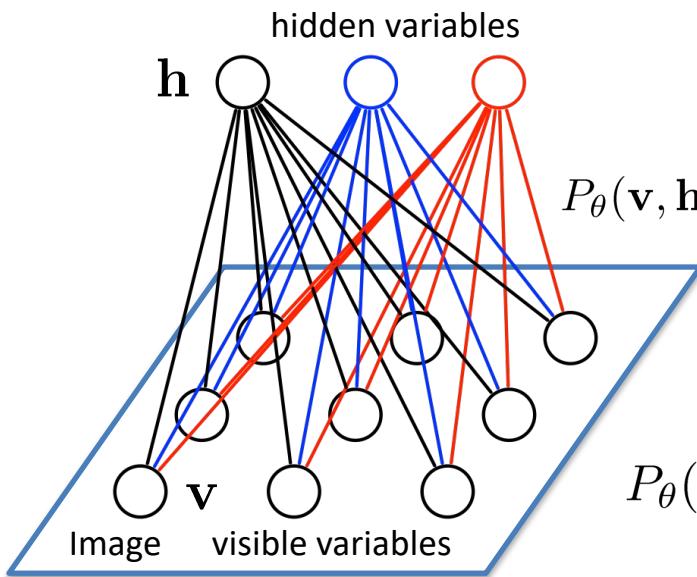

- Let \mathbf{x} represent a real-valued (unbounded) input.

- add a **quadratic term** to the energy function

$$E(\mathbf{x}, \mathbf{h}) = -\mathbf{h}^\top \mathbf{W} \mathbf{x} - \mathbf{c}^\top \mathbf{x} - \mathbf{b}^\top \mathbf{h} + \frac{1}{2} \mathbf{x}^\top \mathbf{x}$$

- In this case $p(\mathbf{x}|\mathbf{h})$ becomes a Gaussian distribution with mean $\mu = \mathbf{c} + \mathbf{W}^\top \mathbf{h}$ and identity covariance matrix
- recommend to **normalize the training set** by:
 - subtracting the mean of each input
 - dividing each input by the training set standard deviation
- should use a smaller learning rate than in the regular RBM

Gaussian Bernoulli RBMs

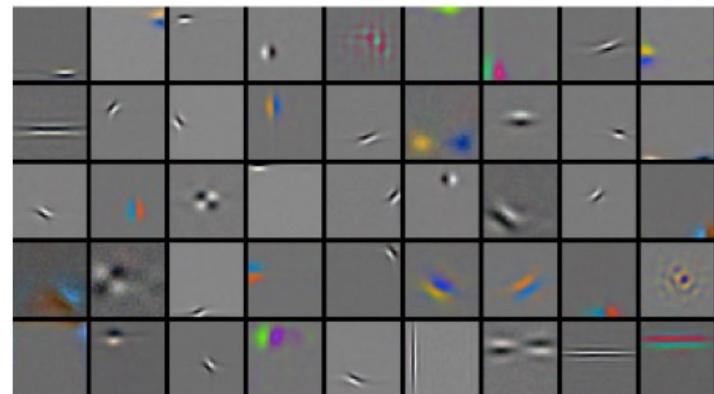

$$P_{\theta}(\mathbf{v}, \mathbf{h}) = \frac{1}{Z(\theta)} \exp \left(\sum_{i=1}^D \sum_{j=1}^F W_{ij} h_j \frac{v_i}{\sigma_i} + \sum_{i=1}^D \frac{(v_i - b_i)^2}{2\sigma_i^2} + \sum_{j=1}^F a_j h_j \right)$$

Pair-wise **Unary**

$$\theta = \{W, a, b\}$$

$$P_{\theta}(\mathbf{v}|\mathbf{h}) = \prod_{i=1}^D P_{\theta}(v_i|\mathbf{h}) = \prod_{i=1}^D \mathcal{N} \left(b_i + \sum_{j=1}^F W_{ij} h_j, \sigma_i^2 \right)$$

Learned features (out of 10,000)

4 million **unlabelled** images

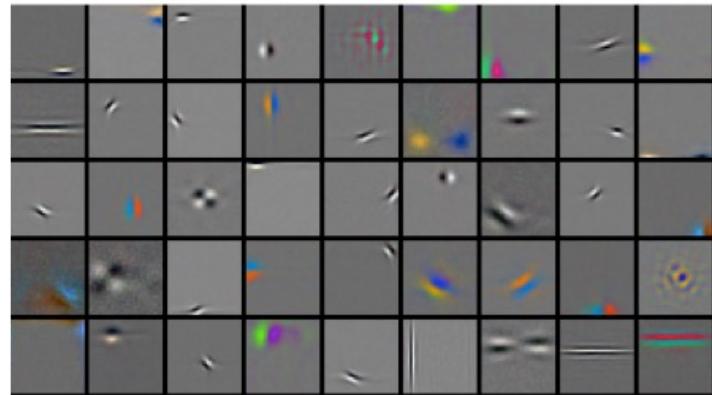

(Notation: vector x is replaced with v).

Gaussian Bernoulli RBMs

4 million **unlabelled** images

Learned features (out of 10,000)

New Image

$$p(h_7 = 1|v)$$

$$= 0.9 * \text{[image]}$$

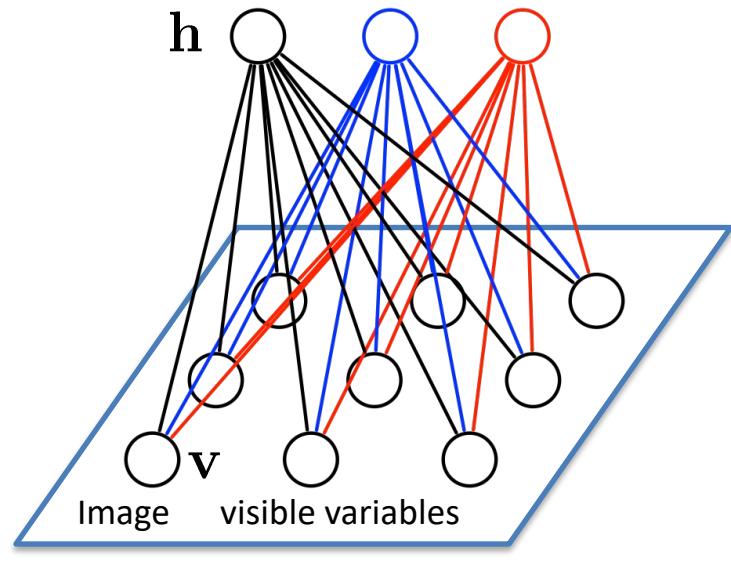

$$p(h_{29} = 1|v)$$

$$+ 0.8 * \text{[image]} + 0.6 * \text{[image]} \dots$$

RBM^s for Images

Gaussian-Bernoulli RBM:

Interpretation: Mixture of exponential number of Gaussians

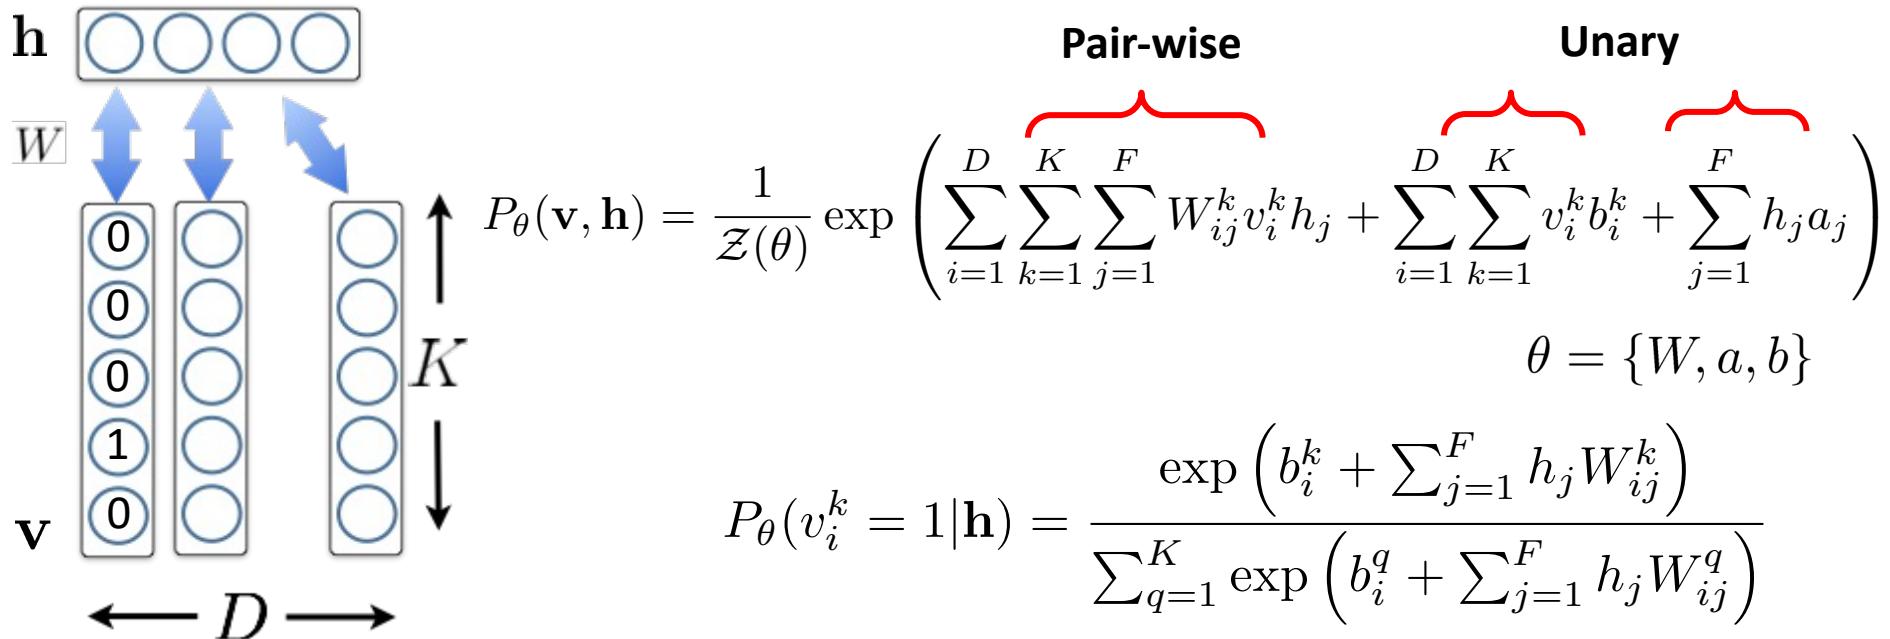

$$P_{\theta}(\mathbf{v}) = \sum_{\mathbf{h}} P_{\theta}(\mathbf{v}|\mathbf{h})P_{\theta}(\mathbf{h}),$$

where

$$P_{\theta}(\mathbf{h}) = \int_{\mathbf{v}} P_{\theta}(\mathbf{v}, \mathbf{h})d\mathbf{v} \quad \text{is an implicit prior, and}$$

$$P(v_i = x|\mathbf{h}) = \frac{1}{\sqrt{2\pi}\sigma_i} \exp\left(-\frac{(x - b_i - \sigma_i \sum_j W_{ij} h_j)^2}{2\sigma_i^2}\right) \quad \text{Gaussian}$$

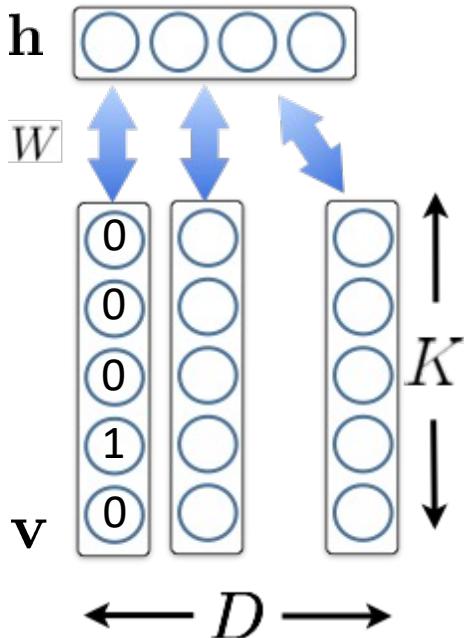

RBMs for Word Counts

Replicated Softmax Model: undirected topic model:

- Stochastic 1-of- K visible variables.
- Stochastic binary hidden variables $h \in \{0, 1\}^F$.
- Bipartite connections.

RBMs for Word Counts

$$P_{\theta}(\mathbf{v}, \mathbf{h}) = \frac{1}{Z(\theta)} \exp \left(\sum_{i=1}^D \sum_{k=1}^K \sum_{j=1}^F W_{ij}^k v_i^k h_j + \sum_{i=1}^D \sum_{k=1}^K v_i^k b_i^k + \sum_{j=1}^F h_j a_j \right)$$

$\theta = \{W, a, b\}$

$$P_{\theta}(v_i^k = 1 | \mathbf{h}) = \frac{\exp(b_i^k + \sum_{j=1}^F h_j W_{ij}^k)}{\sum_{q=1}^K \exp(b_i^q + \sum_{j=1}^F h_j W_{ij}^q)}$$

Reuters dataset:

Different Data Modalities

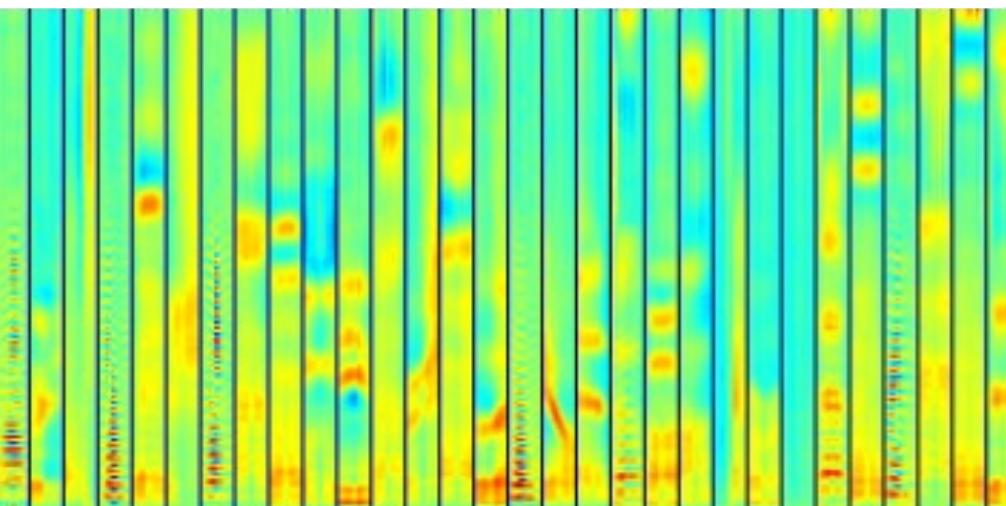

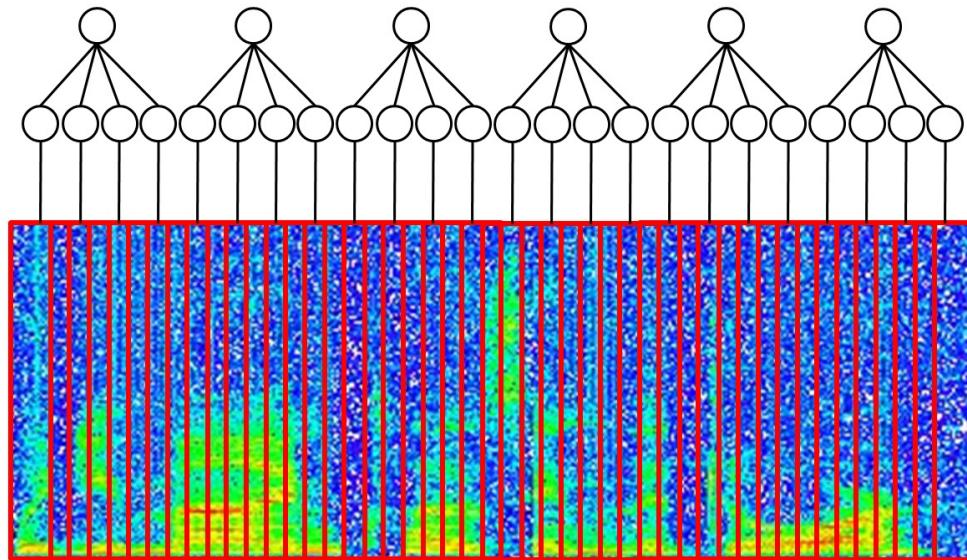

- Binary/Gaussian/Softmax RBMs: All have binary hidden variables but use them to model different kinds of data.

- It is easy to infer the states of the hidden variables:

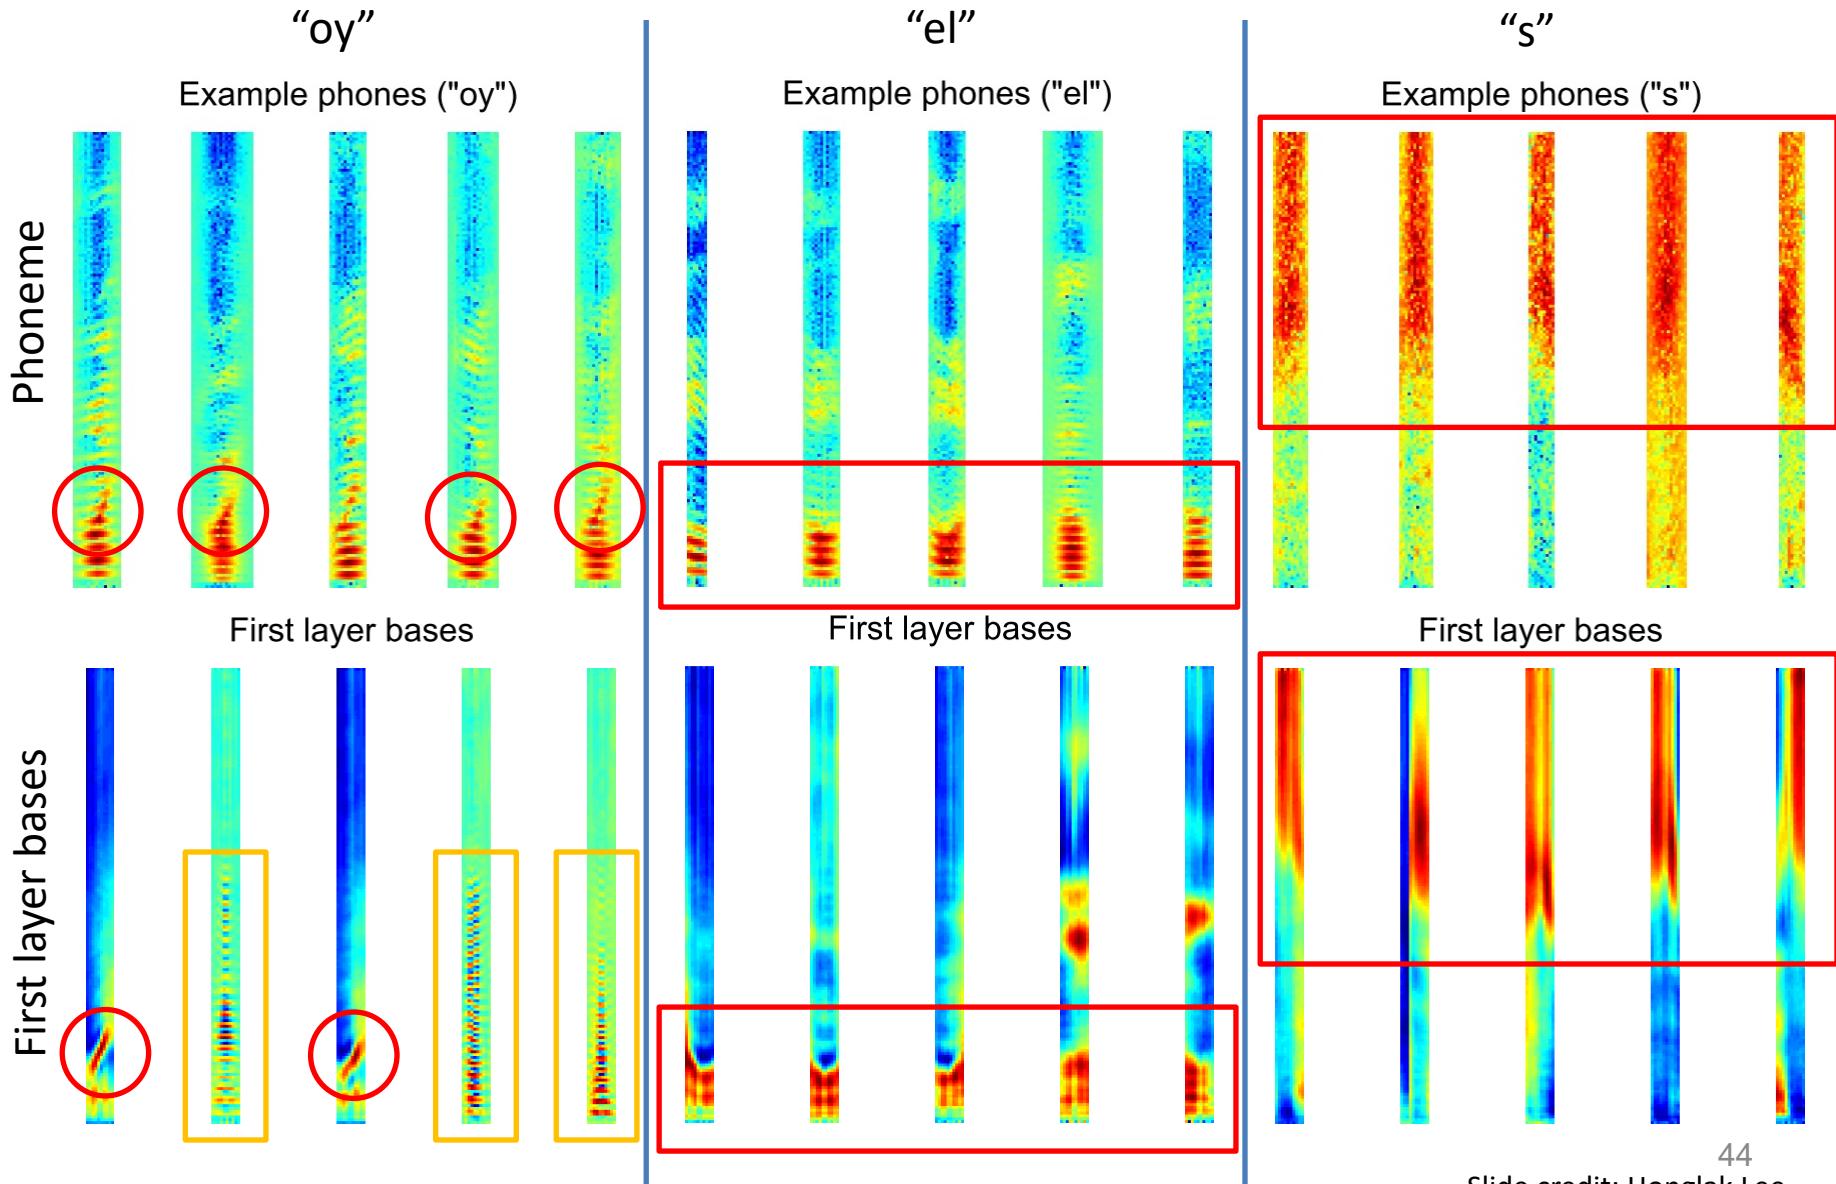

$$P_{\theta}(\mathbf{h}|\mathbf{v}) = \prod_{j=1}^F P_{\theta}(h_j|\mathbf{v}) = \prod_{j=1}^F \frac{1}{1 + \exp(-a_j - \sum_{i=1}^D W_{ij} v_i)}$$

Speech

Learned first-layer bases

Comparison of bases to phonemes

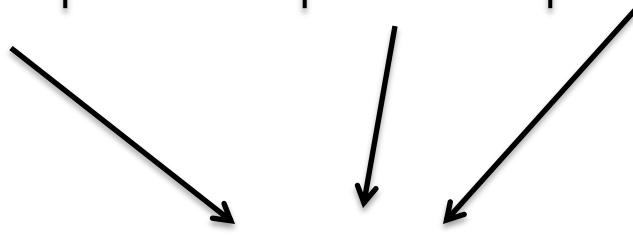

Product of Experts

The joint distribution is given by:

$$P_{\theta}(\mathbf{v}, \mathbf{h}) = \frac{1}{Z(\theta)} \exp \left(\sum_{ij} W_{ij} v_i h_j + \sum_i b_i v_i + \sum_j a_j h_j \right)$$

Marginalizing over hidden variables:

$$P_{\theta}(\mathbf{v}) = \sum_{\mathbf{h}} P_{\theta}(\mathbf{v}, \mathbf{h}) = \frac{1}{Z(\theta)} \prod_i \exp(b_i v_i) \prod_j \left(1 + \exp(a_j + \sum_i W_{ij} v_i) \right)$$

Silvio Berlusconi

Topics “government”, “corruption” and “mafia” can combine to give very high probability to a word “Silvio Berlusconi”.

Product of Experts

The joint distribution is given by:

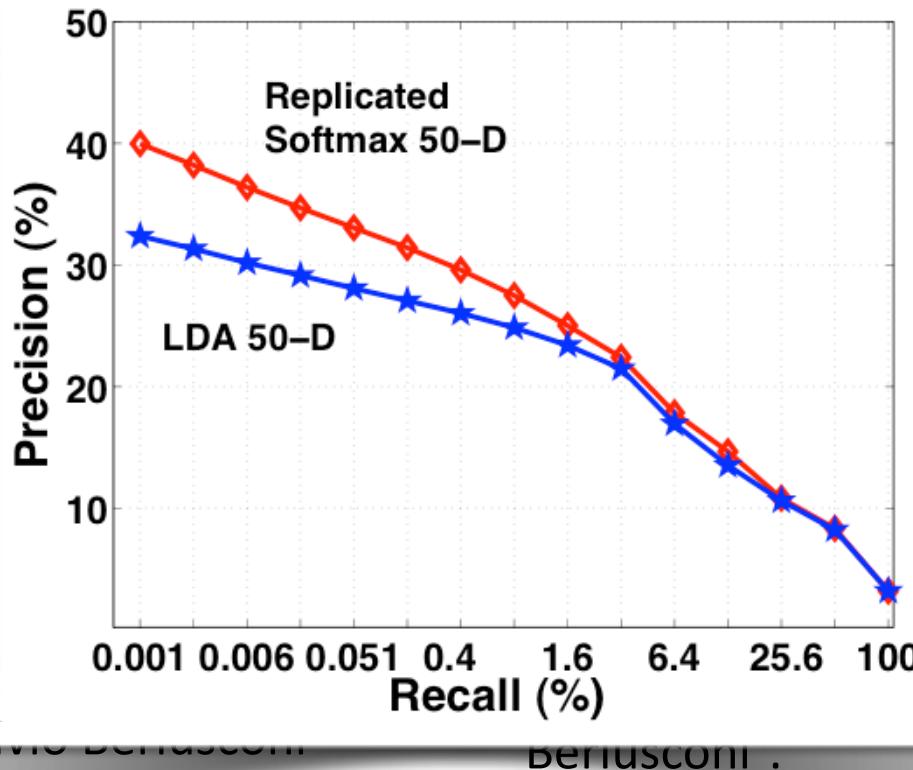

$$P_{\theta}(\mathbf{v}, \mathbf{h}) = \frac{1}{Z(\theta)} \exp \left(\sum_{ij} W_{ij} v_i h_j + \sum_i b_i v_i + \sum_j a_j h_j \right)$$

Marginalizing over \mathbf{h} :

$$P_{\theta}(\mathbf{v}) = \sum_{\mathbf{h}}$$

government
authority
power
empire
federation

clint
hou
pres
bill
cong

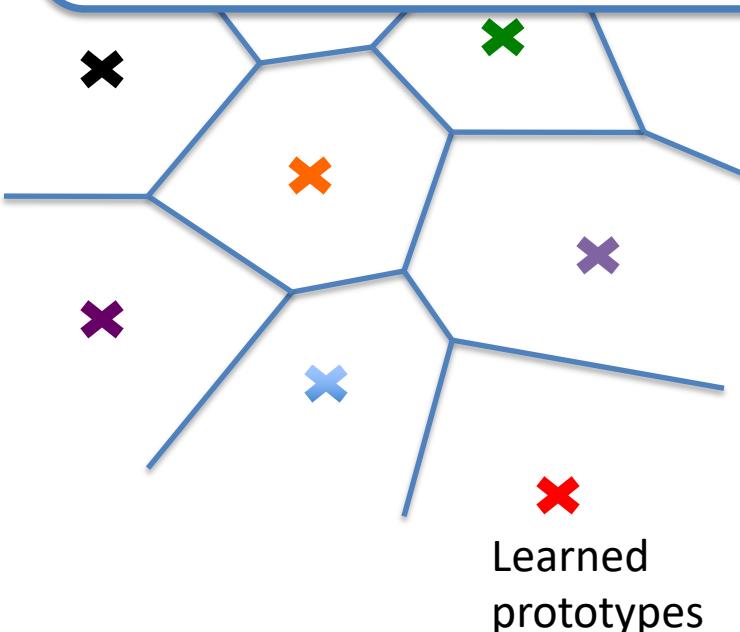

Product of Experts
 $(W_{ij} v_i)$)

"corruption" and
to give very high
"Silvio Berlusconi".

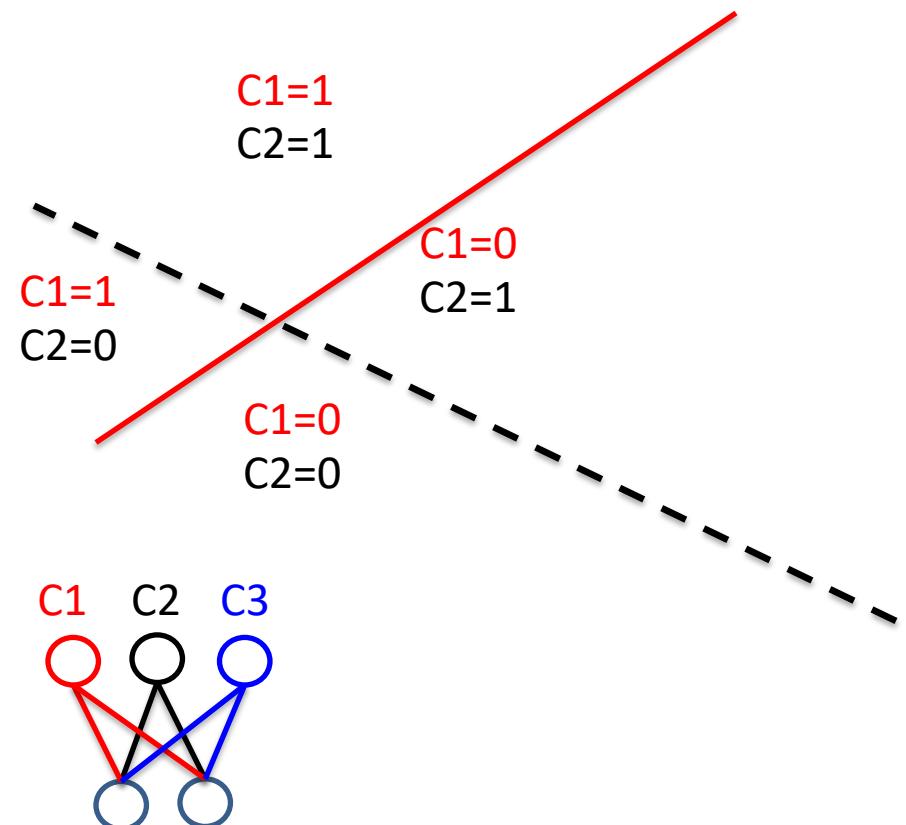

Local vs. Distributed Representations

- Clustering, Nearest Neighbors, RBF SVM, local density estimators

- Parameters for each region.
- # of regions is linear with # of parameters.

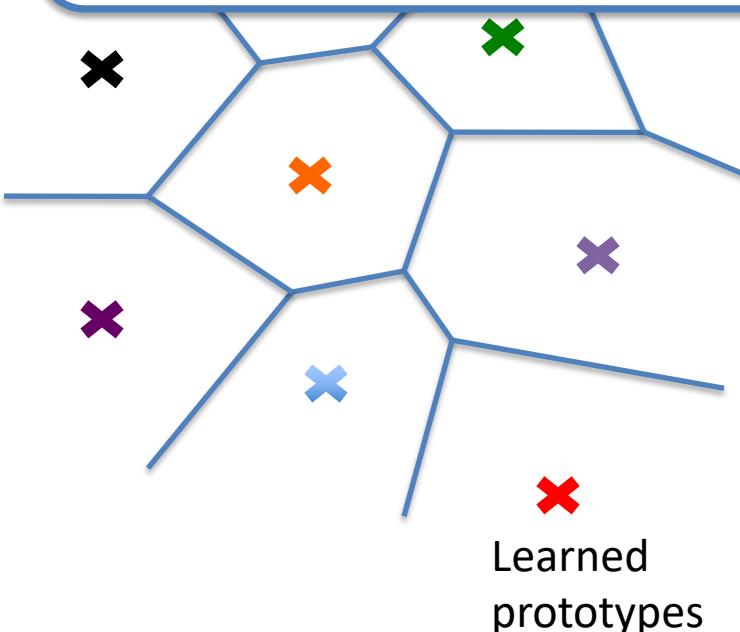

- RBMs, Factor models, PCA, Sparse Coding, Deep models

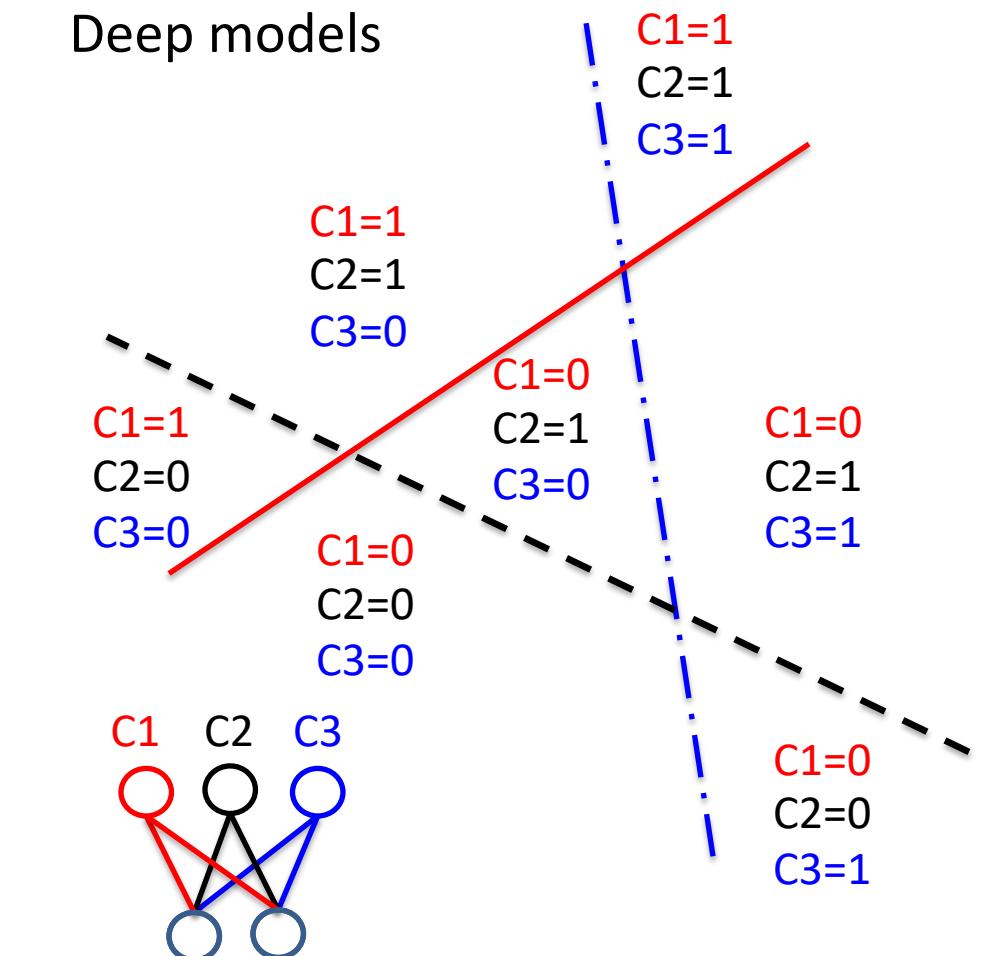

Local vs. Distributed Representations

- Clustering, Nearest Neighbors, RBF SVM, local density estimators

- Parameters for each region.
- # of regions is linear with # of parameters.

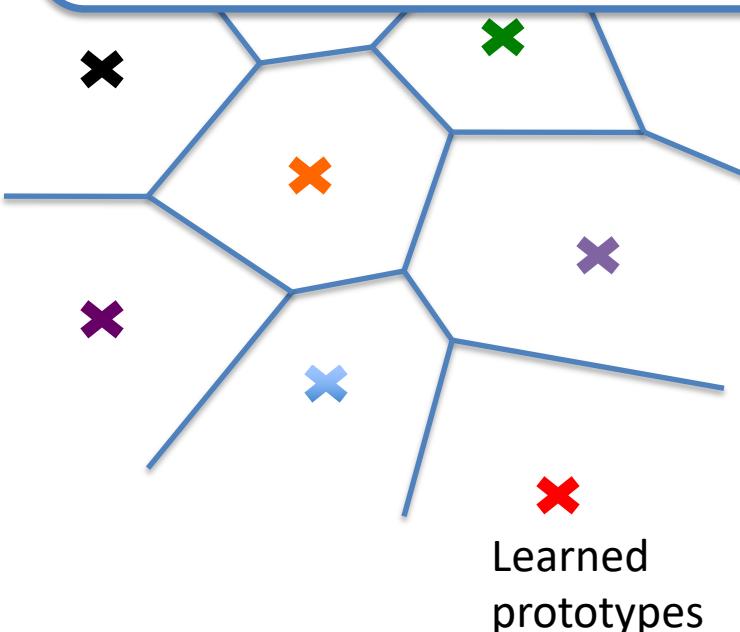

- RBMs, Factor models, PCA, Sparse Coding, Deep models

Local vs. Distributed Representations

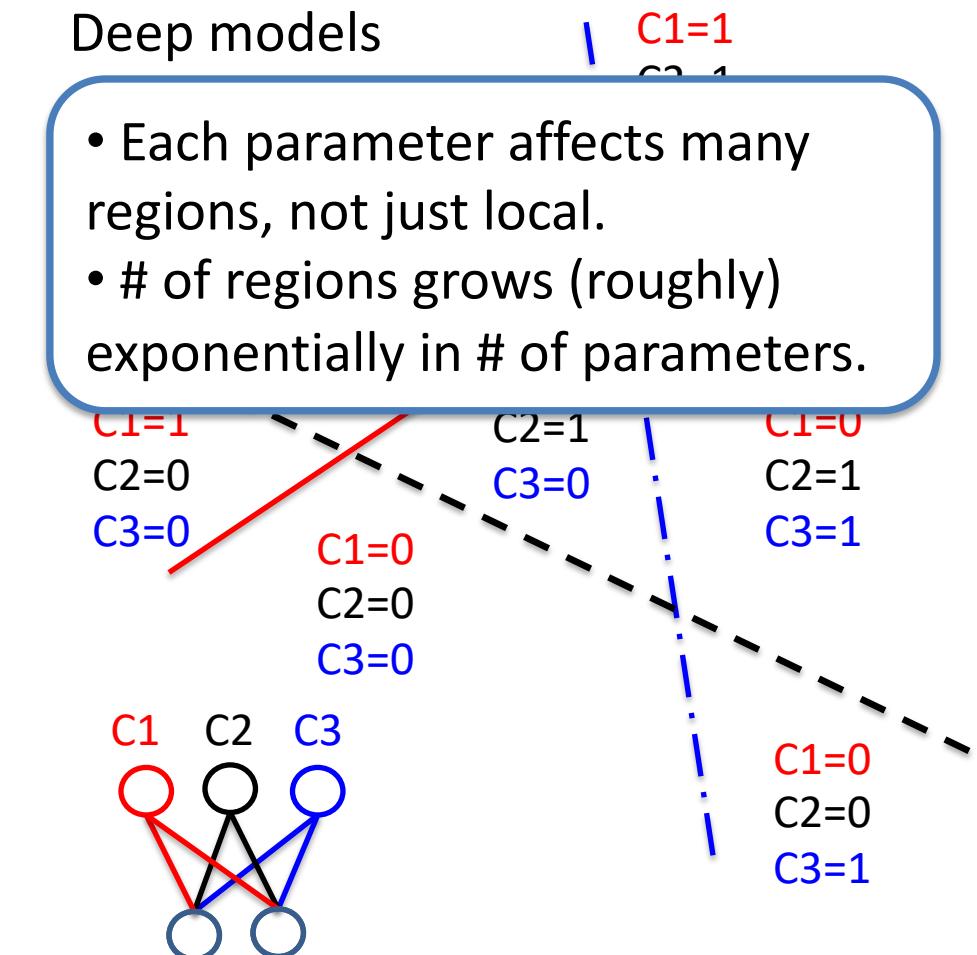

- Clustering, Nearest Neighbors, RBF SVM, local density estimators

- Parameters for each region.
- # of regions is linear with # of parameters.

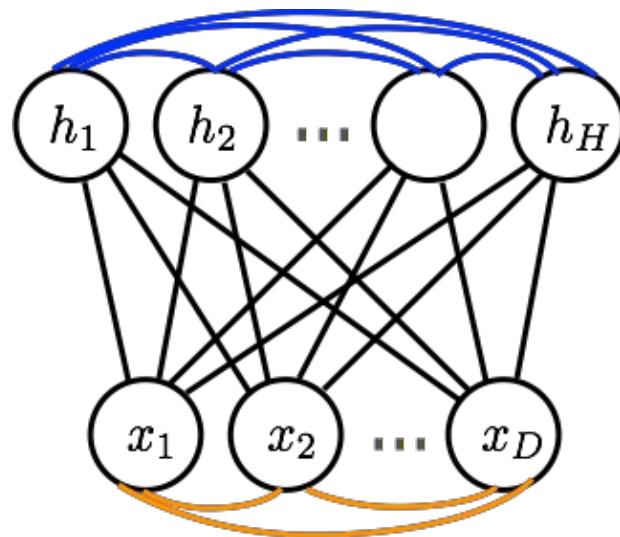

- RBMs, Factor models, PCA, Sparse Coding, Deep models

- Each parameter affects many regions, not just local.
- # of regions grows (roughly) exponentially in # of parameters.

Boltzmann Machines

- The original Boltzmann machine has lateral connections in each layer

$$E(\mathbf{x}, \mathbf{h}) = -\mathbf{h}^\top \mathbf{W} \mathbf{x} - \mathbf{c}^\top \mathbf{x} - \mathbf{b}^\top \mathbf{h}$$
$$-\frac{1}{2} \mathbf{x}^\top \mathbf{V} \mathbf{x} \quad \boxed{-\frac{1}{2} \mathbf{h}^\top \mathbf{U} \mathbf{h}}$$

- when only one layer has lateral connection, the model is called a semi-restricted Boltzmann machine

Multiple Application Domains

- Natural Images
- Text/Documents
- Collaborative Filtering / Matrix Factorization
- Video (Langford, Salakhutdinov and Zhang, ICML 2009)
- Motion Capture (Taylor et.al. NIPS 2007)
- Speech Perception (Dahl et. al. NIPS 2010, Lee et.al. NIPS 2010)

Same learning algorithm --
multiple input domains.

Limitations on the types of structure that can be
represented by a single layer of low-level features!
